I. Problem Statement

Most Filipinos vote recklessly and follow the herd (some, even worse, let their family dictate who they will vote for if unsure) instead of researching for candidates that align with their views. This lack of independent thought and unwise pre-vote decisions is what causes corruption in our country. We made our website to aid the research process for our fellow Filipinos, ensuring votes are educated and fully thought through.

II. Problem Identification

Many individuals participate in the election without researching the candidates or the importance of their choices beforehand. This can include voting for candidates based on random selection or other unprofessional ideas rather than informed decision-making. Some voters also tend to engage in irresponsible voting practices by relying on the opinions of others instead of using their own judgment.

III. Problem Decomposition

Problem 1: How users will login into their accounts to vote/view the number of votes.

Problem 2: How users will see the display of traits, programs, and slogans, of each candidate.

Problem 3: How the program will record the number of votes for each candidate

Problem 4: How the candidates' traits, programs, etc. will be constantly updated and added to.

Problem 5: How users can sift through hundreds to thousands of candidates that may possibly align with their beliefs in politics.

IV. Proposed Solution

- The interface will include multiple tests to gauge the voter's political views and awareness of the current political state of the Philippines.
- The identified problem will be addressed by guiding voters in voting for the right candidate of their choice to avoid any misunderstandings and issues in the voting process in the form of the said software.
- The identified users are the citizens who will vote for their chosen candidate during elections.

V. Feasibility and Scope

This plan covers displaying the traits, programs, and slogans of candidates, wherein the user can select the candidate they intend to know more about. The user can examine each of the candidates' backgrounds to gain more awareness on who they think should be

voted. As they look through the list of candidates registered in the system, there will be an option for them if they want to place their vote after examining the backgrounds of candidates, wherein their responses will be recorded in the system.

The project will not cover each candidate's flaws, display election winners, or provide a history of each candidate. Instead, the code will display a brief description of their background, including their full name, date of birth, the region they represent, political background (if applicable), and other important information. The users will not see any details about previous elections unless a candidate has a record of running in those elections.

The constraints in doing this project include our skills, time, and communication. Due to our overload of requirements, we only had a few days to finish this project because we had to prioritize other requirements with an earlier deadline. While our skills are good enough for an 8th-grader, they are sadly not enough to make a really effective code. However, we believe that researching more about how to code can help improve our project. Also, communication with our team members has been challenging due to our busy schedules. We also lacked communication with our teacher, which may cause future problems.

VI. Team Roles

09, Custodio, Robbee Austin - Developer and Planner

16, Gonzales, Angelika Jade - Planner and Designer

17, Ilagan, Vinn Brycen - Developer and Tester

18, Jarumayan, Eunika Simoune - Planner and Designer

27, Romulo, Neil Joseph - Developer and Tester
